

Bessembinder Before / After — $|\text{ret_comp}| > 10$ Dropped

Compustat daily returns matched to CRSP (CIZ common stock), with any return $|\text{ret_comp}| > 10$ dropped from both panels. RAW = uncorrected Compustat; NEW = Bessembinder (2023) Section 6 decimal corrections + Section 8 filters + gap-guard. $\Delta = \text{ret_comp} - \text{ret_crsp}$. Size groups use Compustat NYSE (`exchg=11`) monthly breakpoints.

$|\Delta|$ Distribution — $|\text{ret_comp}| > 10$ Dropped

Distribution of $|\Delta| = |\text{ret_comp} - \text{ret_crsp}|$ within each size group (% of that group's matched returns), after dropping $|\text{ret_comp}| > 10$ from both panels. RAW = uncorrected; NEW = Bessembinder + Section-8 + gap-guard. Top table: per-bucket frequency (rows sum to 100). Bottom table: cumulative (CDF; rows climb to 100).

Per bucket (no accumulation)
